

EIRIS - Makes Automated and On-Demand Alert Messaging Easy

EIRIS Alerts - One message notifies all!

More than a simple alert messaging mechanism, no other Visibility & Security Management System reaches more people in more relevant ways than EIRIS.

EIRIS Alert Messaging gives you the power to automatically or manually push urgent system notifications and/or critical safety & security alerts 24hrs-a-day to the specific staff members who need them the most regardless of where they are.

With EIRIS you can communicate quickly, effortlessly and reliably with such vital mobile system users as security & safety managers, building administrators, first responders and maintenance personal.

EIRIS Alert Messaging supports email accounts, text pagers, wireless SMS messaging, public address systems, digital visual displays, alarm beacons, loudspeakers and many common mobile and IP protocols.

All EIRIS messaging and delivery mechanism setup screens are flexible, easy to manage or enhance and secure. For example it's easy to setup a low battery alert that during working hours alert is sent to text pagers, but during non-work hours is transmitted to repair personnel via SMS instead. Additionally it's even simple to configure certain alert messages to be transmitted only during weekend hours y but never Monday through Friday.

EIRIS Configuration Options

A complete line of EIRIS Alert Messaging options are available to meet the security requirements of any size organization. Whether needing to secure a small office or a large multi-site enterprise, organizations can start small and then upgrade system options as security, staffing or safety needs change.

Supported delivery mechanisms

- TCP/IP and UDP/IP gateways
- ESPA and TAP text pagers
- Email accounts
- Mobile phones (via SMS text messaging)
- Digital message boards
- Alert beacons & sirens
- Loudspeakers & public address systems
- Third-party text to voice systems
- Other universal emergency notification systems

Standard Features

User/Responder Groups

Administrators can create user groups. For example, the top-level account could send alerts to everyone, but groups might only send alerts to a branch campus, faculty-only, students-only, facilities, executive leadership, or the public safety team.

Templates

Create pre-written messages to be stored as templates that can be delivered to remote uses as text messages whenever specific alerts are triggered.

Natural Voice Alerts

Upload and save pre-recorded voice messages which are to be automatically transmitted to selected remote users whenever specific alerts are triggered.

Open APIs Extend Functionality

Open Application Program Interfaces (APIs) offer real-time, bi-directional alarm/event processing and notification with legacy speech dialers, text to voice systems or universal emergency notification systems.

Integrated Messaging Transaction Reporting

EIRIS' integrated report generator creates historical reports of system activity, alarms and/or alert notifications (by groups) for enterprise-wide information delivery.
