

Messaging Gateway

Description

The Elpas Messaging Gateway enables standalone Elpas Local Controllers to forward system supervision or application event alerts to an on-site (non-dialup) ESPA 4.4.4 paging system using a dedicated physical RS-232 serial interface.

The Messaging Gateway has one supervised analog input for monitoring an alarm sensor and two open collector digital outputs for actuating security output devices. The gateway also supports Ethernet network communications for receiving alerts from the host Elpas Local Controller and is configurable using Eiris Tracking & Management Software.

Constructed of white polycarbonate plastic, the Elpas Messaging Gateway Adapter is wall mountable or placed above dropped ceilings.
