

## **EIRIS V4.6.4 – Software Availability Announcement**

**January, 2010** – EIRIS V4.6.4 contains new usability enhancements, updated features as well as enhanced functionalities that many of our partners have frequently request during the past year.

For example in the EV2 client:

- Badge Searches can now be run by Name, Neuron ID or by any applicable extended property
- A Badge Photo Display option as been added in both Alerts and Badge mode for sites that do not support video enables the user to simultaneously view the real-time location of the selected Elpas tag, SpiderAlert transmitter or VisAccess key on the sitemap and also look at a photo of the user or asset that is currently being tracked or has triggered an alert
- An EIRIS client utility that sends user-selectable alert notifications to a visual alert pop-up box in EV2.
- The user configurable Macro Objects Action buttons (in Setup and Alerts mode) is now saved as part of a specific EV2 client profile

As a new option, the EIRIS History Recorder application can now generate separate monthly database files while the Report Generator application has been updated to now include five new report types.

For the first time, full bi-directional communication between the EIRS server and on-site (non-dialup) TAP compliant pager systems is now supported. Additionally, the automatic installation of a compatible third-party software application can be handled by the EIRIS Setup Wizard.

And finally for Access Control sites, holder filters can be assigned to new users (via the EV2 client) to limit the holder keys that may be viewed. In additional a new Visitor Module default utility is included that functions as an automated paper-less guard station solution for quick and accurate visitor registration.

EIRIS V4.6.4 is available for download from the VT web site at: <http://www.visonictech.com/Eiris.html>.
